Tutorial programs listed by number

- step-1** Creating a grid. A simple way to write it to a file.
- step-2** Associate degrees of freedom to each vertex and compute the resulting sparsity pattern of matrices. Show that renumbering reduces the bandwidth of matrices significantly, i.e. clusters nonzero entries around the diagonal.

step-3	Actually solve Laplace's problem. Object-orientation. Assembling matrices and vectors. Boundary values.
step-4	This example is programmed in a way that it is independent of the dimension for which we want to solve Laplace's equation; we will solve the equation in 2D and 3D, although the program is exactly the same. Non-constant right hand side function. Non-homogeneous boundary values.
step-5	Computations on successively refined grids. Reading a grid from disk. Some optimizations. Using assertions. Non-constant coefficient in the elliptic operator (yielding the extended Poisson equation). Preconditioning the CG solver for the linear system of equations.
step-6	Adaptive local refinement. Handling of hanging nodes. Higher order elements. Catching exceptions in the <code>main</code> function.
step-7	Helmholtz equation. Non-homogeneous Neumann boundary conditions and boundary integrals. Verification of correctness of computed solutions. Computing the error between exact and numerical solution and output of the data in tables. Using counted pointers.
step-8	The elasticity equations will be solved instead of Laplace's equation. The solution is vector-valued and the equations form a system with as many equations as the dimension of the space in which it is posed.
step-9	Linear advection equation, assembling the system of equations in parallel using multi-threading, implementing a refinement criterion based on a finite difference approximation of the gradient.
step-10	Higher order mappings. Do not solve equations, but rather compute the value of pi to high accuracy.
step-11	Solving a Laplace problem with higher order mappings. Using mean value constraints and intermediate representations of sparsity patterns.
step-12	Discontinuous Galerkin methods for linear advection problems.
step-13	Software design questions and how to write a modular, extensible finite element program.
step-14	Duality based error estimators, more strategies to write a modular, extensible finite element program.
step-15	A nonlinear elliptic problem: The minimal surface equation. Newton's method. Transferring a solution across mesh refinement.
step-16	Multigrid preconditioning of the Laplace equation on adaptive meshes.
step-17	Using PETSc for linear algebra; running in parallel on clusters of computers linked together by MPI.
step-18	A time dependent problem; using a much simplified version of implementing elasticity; moving meshes; handling large scale output of parallel programs.
step-19	Input parameter file handling. Merging output of a parallel program.
step-20	Mixed finite elements. Using block matrices and block vectors to define more complicated solvers and preconditioners working on the Schur complement.
step-21	The time dependent two-phase flow in porous media. Extensions of mixed Laplace discretizations. More complicated block solvers. Simple time stepping.
step-22	Solving the Stokes equations of slow fluid flow on adaptive meshes. More on Schur complement solvers. Advanced use of the ConstraintMatrix class.
step-23	Finally a "real" time dependent problem, the wave equation.
step-24	A variant of step-23 with absorbing boundary conditions, and extracting practically useful data.
step-25	The sine-Gordon soliton equation, which is a nonlinear variant of the time dependent wave equation covered in step-23 and step-24 .
step-26	The heat equation, solved on a mesh that is adapted every few time steps.
step-27	hp finite element methods
step-28	Multiple grids for solving a multigroup diffusion equation in nuclear physics simulating a nuclear reactor core
step-29	Solving a complex-valued Helmholtz equation. Sparse direct solvers. Dealing with parameter files.
step-30	Anisotropic refinement for DG finite element methods.
step-31	Time-dependent Stokes flow driven by temperature differences in a fluid. Adaptive meshes that change between time steps.
step-32	A massively parallel solver for time-dependent Stokes flow driven by temperature differences in a fluid. Adapting methods for real-world

equations.

- [step-33](#) A nonlinear hyperbolic conservation law: The Euler equations of compressible gas dynamics.
- [step-34](#) Boundary element methods (BEM) of low order: Exterior irrotational flow. The `ParsedFunction` class.
- [step-35](#) A projection solver for the Navier–Stokes equations.
- [step-36](#) Using SLEPc for linear algebra; solving an eigenspectrum problem. The Schrödinger wave equation.
- [step-37](#) Solving a Poisson problem with a multilevel preconditioner without explicitly storing the matrix (a matrix-free method).
- [step-38](#) Solving the Laplace-Beltrami equation on curved manifolds embedded in higher dimensional spaces.
- [step-39](#) Solving Poisson's equation once more, this time with the interior penalty method, one of the discontinuous Galerkin methods developed for this problem. Error estimator, adaptive meshes, and multigrid preconditioner, all using the [MeshWorker](#) framework.
- [step-40](#) Techniques for the massively parallel solution of the Laplace equation (up to 10,000s of processors).
- [step-41](#) Solving the obstacle problem, a variational inequality.
- [step-42](#) A solver for an elasto-plastic contact problem, running on parallel machines.
- [step-43](#) Advanced techniques for the simulation of porous media flow.
- [step-44](#) Finite strain hyperelasticity based on a three-field formulation.
- [step-45](#) Periodic boundary conditions.
- [step-46](#) Coupling different kinds of equations in different parts of the domain.
- [step-48](#) Explicit time stepping for the Sine–Gordon equation based on a diagonal mass matrix. Efficient implementation of (nonlinear) finite element operators.
- [step-49](#) Advanced mesh creation and manipulation techniques.
- [step-51](#) Solving the convection-diffusion equation with a hybridizable discontinuous Galerkin method using face elements.
- [step-52](#) Solving the time dependent neutron diffusion equation using Runge-Kutta methods.
- [step-53](#) Describing the geometry of complex domains and curved boundaries.
- [step-54](#) Using CAD files to describe the boundary of your domain.

Tutorial programs grouped by topics

Basic techniques

- | | |
|---|--|
| Creating a grid. A simple way to write it to a file | step-1 |
| Degrees of freedom | step-2 |
| Solve the Laplace equation | step-3 |
| Dimension independent programming, non-zero data | step-4 |
| Computing on uniformly refined meshes | step-5 |
| Adaptivity | step-6 , step-26 |
| Evaluating errors | step-7 |
| Nonlinear problems, Newton's method | step-15 |

Advanced techniques

- | | |
|----------------|--|
| Multithreading | step-9 , step-28 , step-32 , step-44 , step-48 , step-51 |
|----------------|--|

Block solvers and preconditioners	step-20 , step-21 , step-22 , step-31 , step-32 , step-43 , step-44
Using Trilinos	step-31 , step-32 , step-33 , step-41 , step-42 , step-43
Parallelization via PETSc and MPI	step-17 , step-18 , step-19 , step-40
Parallelization via Trilinos and MPI	step-32 , step-42
Parallelization on very large numbers of processors	step-32 , step-40 , step-42
Input parameter handling	step-19 , step-28 , step-29 , step-32 , step-33 , step-34 , step-35 , step-36 , step-42 , step-44
Higher order mappings	step-10 , step-11 , step-32
Error indicators and estimators	step-6 , step-9 , step-14 , step-39
Transferring solutions across mesh refinement	step-15 , step-28 , step-31 , step-32 , step-33 , step-42 , step-43
Discontinuous Galerkin methods	step-12 , step-21 , step-39 , step-46 , step-51
hp finite elements	step-27 , step-46
Anisotropic refinement for DG finite element methods	step-30
Computing Jacobians from residuals, automatic differentiation	step-33
Boundary element methods, curved manifolds	step-32 , step-34 , step-38 , step-53 , step-54
Periodic boundary conditions	step-45
Matrix-free methods	step-37 , step-48
Advanced meshes and geometries	step-49 , step-53 , step-54

Linear solvers

Conjugate Gradient solver	step-3
Preconditioned CG solver	step-5
BiCGStab	step-9
Multilevel preconditioners	step-16 , step-31 , step-32 , step-37 , step-39 , step-41 , step-42 , step-43
Parallel solvers	step-17 , step-18 , step-32 , step-40 , step-42
Block and Schur complement solvers	step-20 , step-21 , step-22 , step-31 , step-32 , step-43
Decoupled projection solvers	step-35
Linear Newton systems from nonlinear equations	step-33 , step-41 , step-42 , step-44
Eigenvalue solvers	step-36

Other equations

Helmholtz equation	step-7 , step-29
Elasticity and elasto-plasticity equations	step-8 , step-42 , step-46
The heat equation	step-26
Minimal surface equation	step-15
Quasi-static elasticity equations	step-18 , step-44
Transport (advection) equations	step-9 , step-21 , step-31 , step-32 , step-43 , step-51

The nonlinear hyperbolic Euler system of compressible gas dynamics	step-33
Mixed Laplace, Darcy, Porous media	step-20 , step-21 , step-43
Stokes and incompressible Navier-Stokes flow	step-22 , step-31 , step-32 , step-35 , step-46
The wave equation, in linear and nonlinear variants	step-23 , step-24 , step-25 , step-48
A multigroup diffusion problem in neutron transport	step-28
Irrotational flow	step-34
An eigenspectrum problem	step-36
The obstacle problem, a variational inequality	step-41 , step-42
Coupling different equations in different parts of the domain	step-46

Vector problems

Elasticity and elasto-plasticity equations	step-8 , step-42
Mixed Laplace	step-20
Mixed Laplace plus an advection equation	step-21 , step-43
Incompressible Stokes and Navier-Stokes flow	step-22 , step-31 , step-32 , step-35
A complex-valued Helmholtz problem	step-29
The Euler equations of compressible gas dynamics	step-33
Coupling different equations in different parts of the domain	step-46

Time dependent problems

The heat equation	step-26
Quasi-static elasticity	step-18 , step-44
Porous media flow	step-21 , step-43
The wave equation, in linear and nonlinear variants	step-23 , step-24 , step-25 , step-48
Time dependent Stokes flow driven by buoyancy	step-31 , step-32
The Euler equations of compressible gas dynamics	step-33
Time dependent neutron diffusion equation	step-52
